# **Asset**

### Francisco Jair Hernandez Sanchez

# **Technical Field**

This project involves the technical field of AI-assisted software development and AI-powered programming. Some fields also included are Machine Learning for code generation, code completion and suggestion systems.

## **Background Information**

The inspiration comes from AI like Copilot and ChatGPT. Not many people have a lot of time on their hands, so what if there was a way to save time while coding and learning at the same time. Sure, AI is there to help but can be easily abused without it helping the user learn. Asset aims to help -frontend developers manage their time making it easier and more efficient for them to do their work.

# **Prior Art (Research)**

Cursor - the AI code editor. Cursor Blog RSS. (n.d.). https://www.cursor.com/enLinks to an external site.

Many IDEs are already integrating AI to help with these issues but are new since AI is still developing like Cursor which became a thing in 2023. Cursor predicts the users' next edit, allows you to chat with it while in the IDE, it even uses images to generate code and helps build the users software faster. Asset differs by guiding users and not straight up giving users the answers it will also give them suggestions to what they could do different.

```
® mod.rs
                                                                CHAT
                                                                       COMPOSER
src > listeners > @ mod.rs
           async fn ⊆ #⇔ Accept #⊗ Reject ↑ ↓ (Vec
                                                               How could I make it easier to switch certificates in the transport
              None
           /// Called to get SNI-specific certificates f
/// Returns a tuple of (certificate_chain_pem;
                                                               I can help you enhance the certificate flexibility by leveraging the
                                                               existing TlsAccept trait. Here's how we can modify the code to
           async fn get_certificates_for_sni(&self, serve
                                                               make certificate switching easier:
               self.get_certificates().await // Fall back
     pub type TlsAcceptCallbacks = Box<dyn TlsAccept + !</pre>
      #[derive(Default)]
                                                                 #[async_trait]
                                                                 pub trait TlsAccept {
       pub struct TlsConfig {
          pub cert_path: Option<String>,
          pub key_path: Option<String>,
           pub tls_accept: Option<TlsAcceptCallbacks>,
                                                                      async fn get_certificates(&self) -> Option<(Vec<</pre>
       struct TransportStackBuilder {
           14: ServerAddress,
           tls: Option<TlsSettings>,
           tls_config: Option<TlsConfig>,
                                                                + ® mod.rs Current File ×
       impl TransportStackBuilder {
            pub fn build(&mut self, #[cfg(unix)] upgrade_l
```

## **Project Description**

Developing a live service AI mobile app/web application that can be integrated into an IDE that edits and gives suggestions like Grammarly to front-end developers to save time while making sure their work is to their liking. By understanding how to start making websites and designing them will only help the user further understand how to make something your own instead of fully relying on AI. AI Art Generation will help the user figure out how to use AI when it comes to designing.

## **Innovation Claim**

This innovation aims to help front-end developers manage their time making things easier for them and making it more efficient for them to work.

# **Usage Scenario**

With many front-end developers not having a lot of time to do things like grocery shopping or just being with their family due to how long it takes to create projects, Asset helps with this issue. It works with the user as they work on their projects, by suggesting and giving live feedback instead of the user having to go back and forth with their project and the IDE. It also provides the user with the opportunity to learn and improve with their projects.

### **SIP BRIEF PART 2**

## **Evaluation Criteria**

- Does the AI tool integrate seamlessly into the IDE without technical issues?
- Does the AI provide real-time feedback while the user codes?
- Can users customize the level of AI assistance they receive?
- Does the AI tool reduce the overall time required to complete front-tend development tasks?
- Does it minimize the need for users to switch between multiple tools or resources while coding?
- Can the AI identify repetitive tasks and offer automation suggestions?
- Does AI improve workflow efficiency without compromising code quality?
- Does the tool encourage learning by providing explanations along with suggestions?
- Can the AI suggest alternative coding approaches to improve the user's understanding?
- Does the tool help users learn best practices in front-end development?
- Does the AI tool assist users in designing front-end elements through AI-generated art?
- Do users find the tool intuitive and easy to use?
- Can users provide feedback directly through the tool?
- Does the AI adapt to different user skill levels?

## Goals and Tasks Associated with the Project

1. Develop AI integration for IDE Assistance

Objective: Ensure seamless AI integration into IDE to provide real-time feedback suggestions, and improvements for front-end developers.

#### Tasks:

- Research APIs and frameworks to enable AI-assisted code completion and analysis.
- Develop and AI-powered an AI-powered suggestion engine that analyzes code in realtime

- Implement context-aware AI feedback that offers explanations alongside suggestions.
- Test AI integration across different front-end frameworks
- Optimize AI performance to ensure minimal lag in real-time suggestions

## 2. Implement AI-Driven Learning Support

Objective: Provide AI-generated explanations, alternative coding approaches, and best practices recommendations to enhance the learning experience.

- Design an AI-driven educational mode that explains AI suggestions in depth.
- Implement a feature where users can request step-by-step breakdowns of suggested code
- Develop a system to track user progress and learning milestones
- Provide different AI assistance levels like beginner, intermediate, expert
- Collect and analyze user feedback to refine the AI's learning assistance

## 3. Enhance Time-Saving Capabilities for Developers

Objective: Reduce the development time by minimizing repetitive tasks and improving workflow efficiency.

### Tasks:

- Develop an AI-powered automation feature for repetitive coding patterns
- Implement smart autocomplete to predict and complete code more efficiently
- Enable the AI to recognize and suggest reusable components for UI development.
- Ensure the AI optimizes front-end performance by identifying unnecessary code

### 4. Integrate AI Art Generation for UI/UX Assistance

Objective: Assist front-end developers in designing visually appealing web interfaces using AI-generated art and UI recommendations.

### Tasks:

- Implement an AI model that generates web design suggestions based on user input
- Develop a feature that allows users to adjust AI-generated UI elements to fit their preferences
- Integrate a feedback loop where users can refine AI-generated designs
- Ensure compatibility with common front-end design tools like Figma and Adobe XD
- Train the AI to recommend accessible and user-friendly design principles.

### 5. Ensure Usability and user Satisfaction

Objective: Create an intuitive user experience that makes AI-assisted front-end development efficient and enjoyable.

### Tasks:

- Conduct usability testing with developers to identify pain points
- Implement a user-friendly interface for AI suggestions and learning assistance
- Develop customizable AI settings to tailor assistance to individual developer needs
- Offer an interactive tutorial to onboard new users efficiently
- Allow users to provide real-time feedback on AI suggestions
- Optimize AI outputs to be clear, concise and non-intrusive to the developers workflow
- 6. Maintain Technical Performance and Stability

Objective: Ensure the AI tool operates effectively, securely and reliably across multiple environments.

#### Tasks:

- Conduct load testing to assess AI response time under different workloads.
- Optimize AI models to balance accuracy with speed
- Implement error-handling mechanisms to prevent system crashes
- Ensure data security and privacy by following best practices in AI ethics
- Continuously update AI algorithms based on performance metrics and user feedback
